PRESS RELEASE

**New** to the CEDRA product line is the [CEDRA-AGSTools](#) software which is a collection of VB.NET software procedures designed for incorporation into new and existing ArcGIS Server Web Applications. Recognizing the growing interest of users to create Web based applications, the CEDRA-AGSTools software provides users the ability to incorporate specialized Viewing, Buffering, Exporting and Data Management tools into their Web based applications. Distributed in source code form, users are able to use the software as is or customize the software to meet their specific requirements.

Included with the software is a 1 year support plan that provides users assistance in the installation of the software, minor customization and software updates. Those interested in learning how the CEDRA-AGSTools software is incorporated into an existing ArcGIS Server Web Application should check out the [August 2009](#) issue of Command of the Month.

Since the software is distributed in source code form, users are able to see exactly how the software is structured and make any desired modifications. The inline documentation provides an excellent means for users to learn how to use the ArcGIS Web ADF in developing ArcGIS Server Web Applications. The techniques shown in the code can then be applied to develop other custom tools. User will also realize that the license fee for the CEDRA-AGSTools software is far less than the cost to hire a consultant to develop all of the tools included in the CEDRA-AGSTools software. Additionally, there is no limit to the number of users that can access the tools within the CEDRA-AGSTools tools and there are no royalty fees if the CEDRA-AGSTools software is used to develop other ArcGIS Server tools.
